

Advantages of Field Capacitors

Overview

Capacitors have a much lower capacity of energy when compared to batteries. This is why batteries are used in applications that will need to supply energy for a longer period. Capacitors are generally used in applications where they will supply energy for a few seconds or less. Capacitors only have a limited amount of storage. When a capacitor is fully charged it can not take any more energy and the excess voltage is wasted. Capacitors cannot store charges for long periods of time. Once a capacitor holds energy for long periods of time the level of voltage will start to drop. This is due to the characteristics of the capacitor and the materials that are used in. The level of stored voltage in a capacitor can vary. What we mean by this is the amount of energy in a capacitor is not fixed. If voltage is applied to a capacitor for a period of time it may not be enough to charge to its full level of.
