

Capital energy storage for microgrids

Overview

Depending on the complexity, microgrids can have high upfront capital costs. Microgrids are complex systems that require specialized skills to operate and maintain. A microgrid is a group of interconnected loads and distributed energy resources within clearly defined electrical boundaries that acts as a single controllable entity with respect to the grid. The investment, made in partnership with SER Capital Partners, will provide MGN with additional funding to advance current projects and pursue. First-of-a-kind and fully sustainable microgrid platform, developed to support the long-term vision of the California Public Utility Commission and PG&E to ensure Calistoga's power resiliency during Public Safety Power Shutoffs (PSPS), creates blueprint for future installations across California. MGN's energy facilities directly address these risks, increase the value of real estate where they are located, create a new foundation for economic growth and competitive advantage in the city where our company was founded. A recent NYSERDA study concluded that facilities like the ones we build. We have around 21 BESS and microgrid sites with 442 megawatts (MW) of utility-owned energy storage and another 40+ MW in development.
