

Economic calculation model for large-scale energy storage

Overview

The power system faces significant issues as a result of large-scale deployment of variable renewable energy. Power operators have to instantaneously balance the fluctuating energy demand with the volatile energy. Over time, financial modeling has proven to be a critical task in major investment decision. The model is built to evaluate the project assumptions, inputs, as well as to perform a full cash flow analysis to assess whether a project is viable. The following findings can be derived. 3.1. Structure of project finance

Several basic features are present in every project finance framework. The fundamental constituents of a project structure are dependent. The financial evaluation determines whether the project's projected future cash inflows are sufficient to persuade lenders and project sponsors to participate in the project investment. The financial ratio analysis includes fundamental analytical methods which provide a unified look into the financial statement of a project and give insights into its underlying situation.
