

How big a solar panel should I install on my RV

Overview

Getting a complete list of electrical appliances, devices and components you'll use in your RV is the most critical part of sizing the electrical system. Underestimate it and you may run out of power. Overestimate it and you may waste money. The aim of the calculation is to size your camper electrical setup so you have enough power every day. With this in mind, it's important to consider your most heavy usage day. Maybe the watts of most devices can be found either printed on the device, in the operating manual or the manufacturer's website online. Sometimes, products list the power usage. The labels or specification of most appliances state whether it is AC or DC. Failing that, if it has a plug you can use in your home sockets, it is probably an AC appliance. For example, if you have more than 5 devices to list follow these steps: 1. Enter the first 5 devices 2. Press the "add more devices" button 3. A further 5 rows are displayed for you to add more.
