

How can we use solar tubes to generate electricity

Overview

Concentrating solar-thermal power (CSP) systems use mirrors to reflect and concentrate sunlight onto receivers that collect solar energy and convert it to heat, which can then be used to produce electricity or stored for later use. It is used primarily in very large power. Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar radiation. A solar tube light or sun tunnel can be an energy-efficient and eco-friendly way to brighten up dark areas in buildings, such as hallways, bathrooms. While they don't allow for a nice view of the outside world, they do provide a natural, cost effective way to naturally illuminate dark interior spaces without using electricity. On the left: a dark bathroom space before a solar tube installation. That's enough to illuminate a 200 sq.
