Overview

Motivated by our collaborative projects with an electrical engineering company in China, this paper specifically focuses on the integrated location and routing (ILR) problem, which involves locating service ways, inverters, combiner boxes, and routing cables to connect them. Abstract-This paper aimed at developing a conventional procedure for the design of large-scale (50MW) on-grid solar PV systems using the PVSYST Software and AutoCAD. The actual design criteria could include: specifying a specific size (in kWp) for an array; available budget; available roof space; wanting to zero their annual electrical usage or a number of othe charged by renewable energy sources. That point is called the “point of interconnection,” or POI. The POI is different for utility-scale versus. Each solar panel contains multiple photovoltaic (PV) cells that capture sunlight and convert it into DC (direct current) electricity. If there is an overcurrent fault they command the circuit breakers to open the circuit.
