

Lithium battery in circuit

Overview

There's a whole bunch of ways to charge the cells you've just added to your device – a wide variety of charger ICs and other solutions are at your disposal. I'd like to focus on one specific module that I believe it's important you know more about. You likely have seen the blue TP4056 boards around – they're cheap and you're. Just like with charging ICs, there's many designs out there, and there's one you should know about – the DW01 and 8205A combination. It's so ubiquitous that at least one of your store. For a 4.2 V Lilon cell, the useful voltage range is 4.1 V to 3.0 V – a cell at 4.2 V quickly drops to 4.1 V when you draw power from it, and at 3.0 V. Now you know what it takes to add a Lilon battery input connector to your project, and the secrets behind the boards that come with one already. It's. Now, you've got charging, and you got your 3.3 V. There's one problem that I ought to remind you about – while you're charging the battery, you can't draw current from it, as the charger relies on current measurements to.
