Microgrid benefits haiti

Overview

Microgrids can deliver more power and can cost-effectively energize commercial and small industrial processes to not only save customers money otherwise spent on kerosene, candles and diesel but to also unlock new economic opportunities and build local resiliency. EarthSpark's microgrids are community sized electricity systems that deliver affordable, reliable, 24/7 electricity to homes and businesses in towns that have never before had any (or any reliable) electricity service. Community-size electricity grids powered by the sun and managed with smartgrid. Working in Haiti since 2009, EarthSpark began by partnering with organizations in the small town of Les Anglais to develop a supply chain for small household-scale solar lights that could displace kerosene lamps and efficient cookstoves and that could reduce charcoal consumption by both delivering. The Project aims to develop 22 community-scale solar plus battery storage micro-grids in southern Haiti in communities where currently no grid power exists. The Project will provide affordable and reliable 24/7 access to modern energy services in communities previously identified through extensive. Activities under this collaboration focus on developing and deploying analytic tools, policy advice, and technical assistance to promote the deployment of advanced energy technologies and systems to enable self-reliant, secure, resilient, and sustainable economic growth in Haiti. Key workstreams. Nearly three-quarters of Haiti's 10 million citizens lack access to reliable electricity.
