

Reactor and capacitor bank

Overview

Having above information, it is possible to find fitting cubicle for the elements of the capacitor bank. Because the device is going to operate at the mains, where higher order harmonics are present, power capacitors must be protected by reactors. Each capacitor emits additional amount of heat as well as a reactor. The arrangement of the elements inside the enclosure should be easily available for maintenance and replacement, and each element should be clearly marked according to the technical. The next step is to choose appropriate power capacitors. It means, that one needs to pay attention to its rated voltage and power. Since the capacitors will be working in series with. The short circuit protection of the capacitors is provided by the switch disconnectors. For the capacitors the fuse link rated current should. The last step is to select the protection of the capacitors as well as the contactors. In order to do so, one has to skim the catalogue cards of the.
