

What does a mica capacitor look like

Overview

Mica which means a group of natural minerals is a type of capacitor that is used in electrical systems and circuits. As the name suggests the material that is used for the dielectric is mica. There are two different types of mica capacitors: silver mica capacitors and clamped mica capacitors. We no longer use clamped. As there are two different types of mica capacitors they can be made by using two different methods. Even though we do not use clamped mica capacitors anymore we will still take a look at the. Like many other types of capacitors, mica capacitors have their specific property benefits why they are used in electrical circuits and systems. We will now take a look at some of these. Mica capacitors are used in electrical circuits and systems that require low capacitance values with high stability. As we stated before, clamped mica capacitors are classed as obsolete.
