

# What is the grid-connected startup of a microgrid

## Overview

Grid-connected microgrids: They have a physical connection to the utility grid through a switching mechanism at the point of common coupling (PCC); however, they can be disconnected into island mode and reconnected back to the main grid when required. A microgrid is a group of interconnected loads and distributed energy resources within clearly defined electrical boundaries that acts as a single controllable entity with respect to the grid. It is able to operate in grid-connected and off-grid modes. The interaction hinges on controlled exchange of power and data. Coalition stakeholders include the City of Oakridge, South Willamette Solutions, Lane County, Oakridge Westfir Area Chamber of Commerce, Good Company/Parametrix, Oakridge Trails. A microgrid is a self-contained electrical network that allows you to generate your own electricity on-site and use it when you need it most.

A microgrid is a local electrical grid with defined electrical boundaries, acting as a single and controllable entity. It is able to operate in grid-connected and off-grid modes. Microgrids may be linked as a cluster or operated as stand-alone or isolated microgrid which only operates off-the-grid not be connected to a wider electric power system. Very small microgrids are sometimes called nanogrids when they serve a single building or load.
