

Wind power generation systems and equipment

Overview

Wind turbines use blades to collect the wind's kinetic energy. The blades are connected to a drive shaft that turns an electric generator, which produces (generates). As the world shifts towards cleaner and more sustainable energy sources, wind power plants are playing an increasingly vital role in our global renewable energy landscape. But have you ever wondered about the intricate components that make these massive structures tick?

From the towering main. Wind turbines work on a simple principle: instead of using electricity to make wind—like a fan—wind turbines use wind to make electricity. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. ABB Drives is a global technology leader serving industries, infrastructure and machine builders with world-class drives, drive systems and packages. We help our customers, partners and equipment manufacturers to improve energy efficiency, asset reliability, productivity, safety and performance. Historically, wind power was used by sails, windmills and windpumps, but today it is mostly used to generate electricity.
